LATNER, L. Osiągnięcia służby zdrowia w dziedzinie zwalczania chorób zakaźnych
Achievements of public health in infectious diseases control Polski Tygodnik Lekarski,
Warszawa 1949, 4/29-30 (916-917) Tables 2
The tasks of the newly established Public Health Service in post-war Poland were
enormous. Typhus fever, typhoid and dysentery (and other infectious diseases of the
 alimentary tract) had reached epidemic proportions in a country devastated by war and
 occupation. These tasks have been accomplished, with the result that in 1948 the
 mortality of infectious diseases was lower than in the pre-war era. Large-scale
 hospitalization of the sick, anti-social vaccination (especially against typhoid,
 dysentery, diphtheria and typhus), the help of the Soviet Union in drugs, disinfectants,
 epidemic units (13 teams of 10 persons each were sent to Poland in the spring of 1946)
 and epidemiological experience generally, contributed to the achievement of these
 successes.

Title : Vaccine against hoof-and-mouth disease of the All-Union Institute of Experimental Veterinary Medical Science (VIEV) and its practical application

Periodical : Veterinariya, 9, 33-37, Sep 1954

Abstract : Hoof-and-mouth disease in cattle, sheep, goats, and swine can be controlled by means of a new vaccine, developed by the All-Union Institute of Experimental Medical Science (VIEV). Since the vaccine proved very effective against hoof-and-mouth disease in all of the above-mentioned animals, tests have been carried out to determine its effectiveness when administered to other kinds of animals. The Ministry of Agriculture of the USSR has accepted this vaccine for specific hoof-and-mouth disease prophylaxis. Machinery has been set in motion for mass production of this vaccine. Vaccine VIEV is safe, harmless, and causes no complications. Tables.

"A Biological Method of Diagnosing Types of Foot-and-Mouth Disease Virus by Convalescent Serum," by L. S. Ratner and V. A. Sergeev, All-Union Institute of Experimental Veterinary Medicine, Veterinariya, Vol 35, No 2, 1957, pp 73-76

This article discusses efforts to develop a simple laboratory method for determining types of foot-and-mouth disease virus suitable for use in scientific research veterinary stations, and republic, regional, and oblast veterinary bacteriological laboratories.

Three biological entities were successfully combined and used in these experiments: serum having very stable type-specific protective properties from animals which had recovered from foot-and-mouth disease; newborn white mice susceptible to experimental foot-and-mouth disease; and types A, O, and C laboratory strains of foot-and-mouth disease virus, which can be easily adapted to the organisms of young mice and which differ in stability and standardizability.

SUM. 1345

RAINER, L.S.

The article states that immunological principles well-known in virological practice and experimental data obtained by Skinner on the adaptation of foot-and-mouth disease virus to white mice formed the bases of these experiments. It is pointed out that convalescent sera are highly type-specific in nature, and react only with the virus which caused the initial disease in the convalescent animal. The experimental method is described in detail. The article includes a diagram showing diagnostic types of foot-and-mouth disease virus used on test and control mice. Results of the experiments are presented in tabular form.

The article concludes on the basis of the results obtained that this method was found to be reliably type-specific. It recommends that diagnosis of foot-and-mouth virus with the use of convalescent serum be tested extensively in veterinary practice. (U)

TITLE: The Coating of Freshly Cast Accumulator Grids of Lead-
antimony Alloy and their Disperse Hardening (Namazka svezh-
eotlitykh akkumulyatornykh reshetok iz svintsovo-sur'myanykh
splavov i ikh dispersionnoye tverdeniye)

PERIODICAL: Vestnik Elektro promyshlennosti, 1958, No. 4,
pp. 66 - 70 (USSR).

ABSTRACT: At present, grids of acid accumulators cast from 6 - 8%
lead-antimony alloy are stored in the foundry for at least three
days before being coated, so that they may harden. This article
describes laboratory investigations and factory tests on accumu-
lator grids carried out by staff of the Scientific Research
Accumulator Institute and of the accumulator works. Members of
the Institute's staff that participated in the work are Engineers
V.S. Grigor'yeva, Ye.I. Smushkovich, Senior Technicians N.I.
Vasil'yeva and V.I. Andriyash and of the accumulator works -
chief of laboratory V.A. Menchugin, Engineer N.S. Mamulova,
shop technologist R.G. Konchan and head of the chemical laboratory
Ye.T. Vil'yamovich.
Until quite recently, it was supposed that lead-antimony forms
a first-order diagram and that both components are of unlimited

Card 1/4

110-4-20/25

The Coating of Freshly Cast Accumulator Grids of Lead-antimony Alloy
and Their Disperse Hardening

solubility in the liquid condition and constitute a simple mechanical mixture in the solid condition. Later, it was found that antimony and lead could form solid solutions, so that alloys of this metal could age. Published data on the rate of ageing of lead-antimony alloys is briefly reviewed. Ageing is most marked in alloys containing 0.5 - 3% of antimony, but even for these alloys it is not very great. Alloys containing up to 8% antimony age much less. To increase the hardness of lead-antimony alloys for accumulator manufacture, use should be made of alloying substances, such as copper or arsenic, to the extent of 0.01%. It was established that ageing of lead-antimony alloys is accompanied by the separation of very dispersed antimony. The influence of copper and arsenic is probably associated with changing the form and rate of formation of antimony from super-saturated solutions.

Tests were made under laboratory and production conditions using accumulator plates of 6 - 7.5% lead-antimony alloy. The effects of ageing were observed by periodic measurements of hardness, tensile strength, elongation and other properties. Various test procedures are described and results are given in Tables 1 and 2.

Card 2/4

110-4-20/25

The Coating of Freshly Cast Accumulator Grids of Lead-antimony Alloy
and Their Disperse Hardening

strength of freshly-cast specimens are taken as 100%, then three days ageing increases the tensile strength to 103.5% and the hardness to 111%. These changes are small. The results in Table 2 show that heat treatment at 60 and 100 °C scarcely changes the hardness. The remaining tests also showed that alloys containing 6.5 - 7.5% antimony are almost unaffected by ageing. To study the rate of ageing, grids were tested in bending at various intervals from zero to 72 hours after casting. The results are plotted and show that any change takes place in the first hour or hour-and-a-half. Hence if conveyor production of grids is employed, forced cooling may be necessary. The laboratory tests suggest that accumulator grids could be coated on the conveyor immediately after casting. The results of works' tests on this point are given in Tables 3, 4 and 5 and demonstrate that except for one batch of grids whose antimony content was too low, those which were coated without the three days storage period behaved quite normally; in no case was the rate of scrap higher than usual. Table 5 gives the equally satisfactory results of experimental coatings of negative plates. There are 1 figure and 5 tables.

TITLE:

Electric Power Engineering on a New Level (Elektroenergetiku - na
novyyu stupen')

PERIODICAL:

Elektrichestvo, 1958, Nr 10, pp 86 - 90 (USSR)

of

ABSTRACT:

This is a discussion/ the article by S.M. Gortinskij and I.A. Syromyathnikov published in Elektrichestvo, 1957, Nr 10: 1) Even in electrified regions, as in the Ural, in the Donbass, etc. districts are found which are not connected with the power supply grid. To renounce the construction of small power stations could be of a detrimental effect. It would be most expedient to construct small power stations (with a power not below 25 MW) in greatly simplified power houses in a way enabling them of being translocated from one region to another. 2) Some measures of

Card 1/3

Electric Power Engineering on a New Level

SOV/105-58-10-21/26

rationalizing the construction, operation and distribution of power in the small power field. 3) The economic expediency of supplying new regions from power supply grids and of abolishing small power stations is substantiated by a practical example from planning work. 4) One of the principal reasons for the high prime costs of small steam turbine power stations is a mechanical transposition of the principal engineering schemes and of the design of large power stations to small-scale ones. More up-to-date principles of improving the operation factors of such stations are advanced and a conversion from a solid fuel to a liquid or gas fuel operation is requested. By the latter measure a complete automation of steam turbine power stations will be made possible. 5) Experience gained in the enterprises of the Glavlektrmontazh demonstrated that the time has come to introduce an industrialized method of assembly. Each electrical equipment should be designed as one great block of equipment, weights reaching 2.5 t. 6) Insufficiencies and shortcomings in electrical industry are pointed out. A number of cases are mentioned, where it was impossible to obtain apparatus and parts of equipment which had been developed already a long time ago. There are 1 figure and 2 tables.
